Picking Glass For Your Door, Sidelites, and Transom

Most home owners want the light provided by using some glass in their entry. The reasons given most often by homeowners for not using glass in their entry are concerns about privacy, security or energy efficiency. While these are legitimate concerns today, the privacy issue can be addressed by selecting from one of the many styles of textured glasses.

There are many answers to the security issue also. Glass is available that is tempered, impact rated, hurricane rated, laminated, or even bullet proof.

Energy concerns are addressed by use of insulated glass which can be further insulated by use of a Low-E coatings, and still further by filling with a gas like argon.

There are a myriad of choices for glass. Many customers, over the years have opted for simple **clear tempered glass**. This is merely the standard single sheet of glass which allows for the maximum amount of light to shine through and has the advantage of being the least costly option. Tempered glass is manufactured by sending the glass through a set of rollers into an oven that is heated up to 720 Celsius. It is then rapidly cooled and results in a product that is stronger and when broken shatters into many small pieces. This effect is necessary for safety reasons. Virtually all modern building codes require the use of tempered glass if it is above a certain size. Typical thickness used for tempered glass is 1/8 inch, 3/16 inch, and 1/4 inch.

Leaded Glass Panels are made using combinations of stained glass, textured glass and/or beveled glass where each piece has been hand cut by a glass artisan to a predetermined shape. The pieces are then put together, again by hand, using a coming material, typically lead, but sometimes brass or copper foil in the construction of a window with a discernible pattern or design. Often elaborate sparkling bevel clusters are incorporated into the design adding additional visual impact. These bevels differ from the tempered bevels in that they are smaller and normally have only a one half inch beveled edge. Leaded Glass is the term used and has the supreme advantage of beauty and elegance. The amount of designs that can be produced are infinite, allowing a product to be created that is truly unique in all the world.

Stained glass windows have been produced for centuries. Evidence remains of stained glass windows from 7th century Britain. Reaching its height as an art form during the middle ages, many churches had windows produced that essentially presented stories from the Bible in visual form since there was not widespread literacy at the time. Today the ones that have survived are considered to be priceless works of art.

Leaded art glass by itself has less strength than tempered glass but it can be sandwiched between two sheets of clear tempered or even low E to provide the same benefits as insulated glass. Most of the leaded glass inserts we build here we insulate. We strongly recommend it for our customers in area with harsh winters.

Doors By Decora is proud to have our own Stained Glass Studio and Glass Artisans. We have designed and built Leaded Beveled and Stained Glass for over 30 years for Entry Doors, Church Windows, and Bathroom Windows throughout the United States and many foreign countries.
